

1. Remove placards from tank cars containing Toxic Inhalation Hazard - The removal of such information from rail cars would lead to increased numbers of casualties to responders and the public. It could produce more casualties when considered cumulatively, than would a terrorist attack on a tank car of TIH. Their removal will delay emergency responders efforts to protect themselves and the public. I remember the days before placards, and make no mistake, implementation of this rule would put responders back in the hazmat dark ages. Simply review the history and the potential becomes clear.
